

Voronoi Cell: Unstressed vs. Stressed States

Unstressed (Baseline)

$$\Delta SSV = 0$$

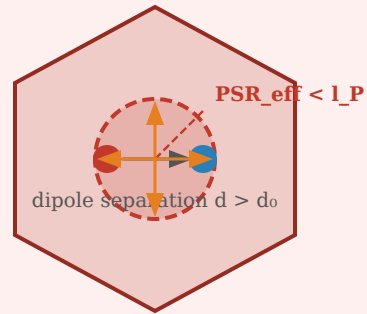

Full displacement budget
available to CP

Cell volume: $V_0 \approx 16.693$ (unit circumradius)

$\Delta SSV \uparrow$
→
stress

Stressed (High ΔSSV)

$$\Delta SSV > 0 \rightarrow PSR_{eff} < l_P$$

Reduced displacement budget
→ more Moments per cycle

$$V_{eff} = V_0 / (1 + k \cdot \Delta SSV)$$

$PSR_{eff} = l_P / (1 + k \cdot \Delta SSV) \rightarrow$ Time dilation: more Moments needed per oscillation cycle
